System Usability Scale

Scoring the two participant experience reports

70.0 / 100

Mean of two individual scores

Report A scored **72.5** and Report B scored **67.5**. They fall on opposite sides of the reference value of 68 printed on the forms. The scores describe perceived usability; they are neither percentages nor measures of task success.

How the responses were scored

Each report has one marked response for all 10 items, from 1 (strongly disagree) to 5 (strongly agree). For odd items, subtract 1 from the response. For even items, subtract the response from 5. Add the ten contributions and multiply by 2.5.

Item	Statement focus	A raw	A adj.	B raw	B adj.
1	Willingness to use again	4	3	4	3
2	Unnecessary complexity	2	3	2	3
3	Ease of use	3	2	4	3
4	Need for instructor support	2	3	3	2
5	Integration of tasks	3	2	4	3
6	Inconsistency across tasks	2	3	3	2
7	Ease of learning	4	3	3	2
8	Frustration or effort	2	3	1	4
9	Confidence	5	4	3	2
10	Learning needed before use	2	3	2	3
Adjusted sum (out of 40)			**29**		**27**
SUS score (out of 100)			**72.5**		**67.5**

Both participants agreed they would use Meridian again. Confidence differed: A strongly agreed that they felt confident (5), while B was neutral (3). A was neutral on ease of use (3); B agreed (4).

Source: Parts 1 and 4 of Reports A and B. The forms adapt SUS wording to this study and attribute the scoring rule to Brooke (1996).

Where participants struggled

Module ratings and retrospective comments

N-back was the shared difficulty

Both participants marked N-back as unclear or high effort and independently named it when asked where they felt uncertain about what to do. This identifies a specific follow-up even though their overall SUS scores were near 70.

Module	Report A	Report B
Session entry	Moderate	Clear
Stimulus playback	High effort	Clear
Self-report ratings	Moderate	Moderate
Stroop	Clear	Moderate
N-back	High effort	High effort
Physiological sweep	Moderate	Clear
System communication	Moderate	Moderate

Key: Clear = clear and seamless; Moderate = moderate or acceptable; High effort = unclear or high effort. These module ratings are separate from the SUS score.

What to test next

N-back. Ask a new participant to explain when to press Match after watching the example, then observe their first match and non-match. This separates understanding the rule from remembering square positions.

Reading and controls. A named the colour task as intuitive, requested a font-size change, and noticed the safety/navigation controls but was unsure when to use them. B found playback intuitive, requested a change to the button interface, and felt comfortable with the safety/navigation controls. Check whether users can read the instructions, seek in a clip and identify how to stop without prompting.

Limits. These are two self-reports about the subject portal. Neither form identifies the tested build or supplies completion times or observed error counts. The results cannot establish a population average or show that later interface changes improved usability.
